Abstract

Time trend analysis of personal care product chemicals in the general US population (National Health and Nutrition Examination Survey, 1999-2016)

By Minglun Wang

Personal care products (PCPs) contain both inert and active ingredients that are purported endocrine disrupting chemicals (EDCs). Since PCPs are typically placed in abundance on the skin, dermal (and inhalational for aerosols) transmission of chemicals into the systemic bloodstream of the body readily occurs and typically at higher levels than most environmental chemical exposures. PCP chemicals of interest include phthalates, parabens, disinfectants (ortho-phenyl phenol, triclosan and triclocarban) and environmental phenols such as bisphenol A. Those active ingredients in PCPs that are purported EDCs are proved to have effects on prenatal growth, thyroid function, glucose metabolism and obesity, puberty, fertility and even carcinogenesis. Because of the acknowledgement of potential adverse health effects on human health, several PCP chemicals are being displaced by substitutes, and few studies focuses on consequent trends in population level exposures. This study examines the time trend in urinary concentrations of phthalate, paraben, and phenol metabolites in the general U.S population and whether trends vary by certain sociodemographic characteristics, by using NHANES dataset from 1999-2016. Our results suggest that minority segments of the population tended to have the highest levels of urinary metabolites for PCPs. For the most part, phthalates and parabens were highest in Hispanic and Black female participants but also were high in all Hispanics and Black participants. Urinary Bisphenol S was highest in Hispanic and Black adolescent and adult males whereas Urinary Bisphenol A was highest in Black children and female adults. Triclosan was highest in Hispanics while Benzophenone-3, a component of sunscreens, was highest in Hispanic females as well as White females. Although this study faces several limitations that may hinder the generalizability, including the cross-sectional design of NHANES, the limitation of biomonitoring, this study has revealed time trends of specific PCP chemicals in the general US population, which can be referred for future research and policy making.

Time trend analysis of personal care product chemicals in the general US population (National Health and Nutrition Examination Survey, 1999-2016)

Introduction

Personal care products (PCPs) contain both inert and active ingredients that are purported endocrine disrupting chemicals (EDCs). Since PCPs are typically placed in abundance on the skin, dermal (and inhalational for aerosols) transmission of chemicals into the systemic bloodstream of the body readily occurs and typically at higher levels than most environmental chemical exposures. PCP chemicals of interest include phthalates, parabens, disinfectants (ortho-phenyl phenol, triclosan and triclocarban) and environmental phenols such as bisphenol A. Those active ingredients in PCPs that are purported EDCs are proved to have effects on prenatal growth, thyroid function, glucose metabolism and obesity, puberty, fertility and even carcinogenesis.

Phthalates, or phthalate esters, are the major type of plasticizers used worldwide. Lower-molecular-weight phthalates, like diethyl phthalate (DEP), di-n-butyl phthalate (DnBP), and diisobutyl phthalate (DiBP) are commonly used in PCPs (Kelly, Koniecki), whereas high-molecular-weight phthalates, such as butylbenzyl phthalate (BBzP), di (2-ethylhexyl) phthalate (DEHP), known as plasticizers in polyvinyl chloride (PVC) application in toys and food packaging (Schechter et al. 2013; Stringer et al. 2000). Studies show that urinary metabolites of DEP, DnBP, BBzP and DEHP have been widely detected in the general U.S. population since 1999-2000 cycle, when these metabolites were first systematically introduced to the National Health and Nutrition Examination Survey (NHANES) (Silva et al. 2004; Woodruff et al. 2011). Among different sociodemographic subgroups, like vulnerable population including women, children, elderly and certain race, higher concentrations of such phthalate urinary

metabolites were discovered. Phthalates are proved to differ in toxicity depending on their chemical structure and the timing of exposure (National Research Council 2008). Many other studies also suggested that there is a relationship between phthalates exposures, including DEP, DnBP, DEHP, and DiBP, and results of impaired neurodevelopment, cardiovascular diseases, and potential reproductive system damages, especially to males (Meeker et al. 2009, Mariana et al. 2016).

Phenols and Parabens, known as non-persistent chemicals, can be excreted in urine within 24 hours post exposure, and new evidence suggests that phenols and parabens can accumulate in adipose tissue (Wang et al. 2015). Parabens are a group of alkyl esters of p-hydroxybenzoic acid and suspected metabolism-disrupting chemicals (Hu et al. 2013). For instance, triclosan, benzophenone-3, bisphenol A, and parabens are commonly used in soaps, cosmetics, toothpaste, sunscreen, textiles, and kitchenware (Woodruff et al. 2011). Bisphenol-A (BPA) is employed in the production of polycarbonate plastics and epoxy resins for water bottles, plastic containers, among many other products (Geens et al. 2012). Triclosan (TCS) is an antimicrobial agent extensively used in toothpaste, detergents, and soaps, among various personal care products, implying that human exposure to TCS is significantly frequent (Frederiksen et al. 2014). Benzophenone-3 (BP-3) is commonly existed in sunscreen formulations and in plastics and food packaging materials and serves as a fragrance and flavor enhancer (Calafat et al. 2008). Due to the rising public concern around the toxicity of BPA, Bisphenol S (BPS) have been widely substituted as an alternative, and it is now commonly used in paper products and containers (Liao et al. 2013).

A previous study analyzing biomonitoring data from NHANES suggests that U.S population exposure to phthalates changed dramatically from 2001-2010 (Zota et al., 2014). However, due to significant data gaps, the observed temporal trends were hard

to interpret and only one class of chemicals was evaluated. More data and research are warranted to explain the trends, and to not only provide more evidence for legislative activity, but to determine the consequences of exposure to PCP chemicals as well. Therefore, this study was to evaluate the time trends in urinary concentration of phthalate, phenols, and paraben metabolites and how they differ by age, sex, race/ethnicity, when these covariates have previously been proved to be associated with endocrine disrupting chemicals in personal care products exposures.

Methods

Study Population

We used extant data from the 1999-2000, 2000-2001, 2003-2004, 2005-2006, 2007-2008, 2009-2010, 2011-2012, 2013-2014, and 2015-2016 cycles of NHANES, to assess the health and nutritional status of adults and children in the United States. We excluded participants who had missing information on gender, race/ethnicity, and age, and we included participants with recorded urinary measurements of phthalate, phenol and paraben metabolites and creatinine, eventually resulting in a sample size of 23,567 study participants. Environmental chemicals were measured in a random 1/3 subset of each cycle (as shown in Table 1).

Phthalate metabolite measurements

Concentrations of phthalate metabolites were quantified using solid phase extraction–high performance liquid chromatography–isotope dilution–tandem mass spectrometry (CDC, 2013). Laboratory files were downloaded from the NHANES website in June 2020. Sixteen phthalates and phthalates alternative metabolites were measured by CDC, but not all of them were measured consistently from 1999-2016. Furthermore, the limit of detection (LOD) and the frequency of detection (FOD) varied by cycle. This project

includes seven phthalates' metabolites detected in more than 60% of the population in each NHANES cycle: Mono-n-butyl phthalate, Mono-ethyl phthalate, MEHP phthalate, Mono-(2-ethyl)-hexyl phthalate, Mono-isobutyl phthalate, MEOH phthalate, and Mono-benzyl phthalate.

Phenol and paraben metabolite measurements

On-line solid phase extraction (SPE) coupled to high performance liquid chromatography-isotope dilution tandem mass spectrometry with peak focusing were used to determine the concentration levels of phenols and parabens metabolites. Laboratory files were downloaded from the NHANES website in June 2020. This project includes six phenol and paraben metabolites detected in more than 50% of the population in NHANES cycle: Urinary Benzophenone-3, Triclosan and bisphenol A were first introduced to NHANES as targeted metabolites in 2003-2004, while urinary Bisphenol S was later added in the 2013-2014 cycle. Methyl paraben and propyl paraben were both first identified as NHANES laboratory variable from 2005-2006 cycle.

Statistical analysis

Analyses were conducted in SAS Studio, version 3.8. We combined nine NHANES cycles, and data files for targeted toxicants, basic demographic information, and albumin/creatinine were merged for all the cycles. FODs were determined for all the relevant toxicants in personal care products, and those toxicants that had FODs lower than 50% were not further evaluated (as shown in Table 2). Age was converted to 5 categorical age groups: 6-12, 12-20, 20-50, 50+ years. Crude data were stratified by multiple individual variables: age group, sex and race/ethnicity, and combined groups to evaluate the impacts of different covariates on the concentration level. Univariate

analyses were conducted in SAS Studio of selected toxicants by NHANES cycle to determine 25th, 75th, 95th percentiles, minimum, maximum, median values, standard errors, and geometric means.

Results

Overwhelmingly, minority segments of the population tended to have the highest levels of urinary metabolites for PCPs. For the most part, phthalates and parabens were highest in Hispanic and Black female participants but also were high in all Hispanics and Black participants. Mono-ethyl phthalate level was highest in Hispanic and Black adolescent and adult groups, while Black children and adolescent has the highest level of MEOH phthalate. Mono-isobutyl phthalate was most abundant in Hispanic children and adolescents, as Black female children had the highest level of Mono-benzyl phthalate. Urinary Bisphenol S was highest in Hispanic and Black adolescent and adult males whereas Urinary Bisphenol A was highest in Black children and female adults. Triclosan was highest in Hispanics while Benzophenone-3, a component of sunscreens, was highest in Hispanic females as well as White females.

Phthalates

As shown in Table 3, Concentrations of Mono-n-butyl phthalate, Mono-ethyl phthalate, Mono-isobutyl phthalate, and Mono-benzyl phthalate were detected in at least 98% of the participants in each NHANES cycle from 1999-2016. Mono-(2-ethyl)-hexyl phthalate were detected in at least 62% of the participants. Both MEHP phthalate and MEOH phthalate were both detected in at least 99% of the participants in both 2013-2014, and 2015-2016 cycles (started from 2013). Concentrations of Mono-n-butyl phthalate, mono-ethyl phthalate, MEHP phthalate, MEOH phthalate, and Mono-benzyl phthalate were significantly lower in 2015-2016 than the first cycle each metabolite introduced to NHANES, while Mono-isobutyl phthalate has a slightly increased level

from the year 2001 (Table 11, 12, 13, 14 &16). Mono-(2-ethyl)-hexyl phthalate has a steady level for all groups throughout 16 years of NHANES data (Table 15). Black female participants had the highest levels of urinary metabolites for MEOH phthalate, Mono-(2-ethyl)-hexyl phthalate and Mono-benzyl phthalate, whereas both Hispanic and Black females have the highest level of Mono-n-butyl phthalate, Mono-ethyl phthalate, MEHP phthalate, and Mono-isobutyl phthalate (Table 11, 12,13, 14, 15, 16, &17).

Phenols and Parabens

Concentrations of Urinary Bisphenol A and Urinary Benzophenone-3 were detected in at least 90% of the participants from each cycle during 2003-2016. Urinary Triclosan was detected in at least 66% of the population from 2013, and Urinary Bisphenol S existed in more than 90% of the participants when the measurement was first introduced in 2013. Both Methyl paraben and Propyl paraben are found in more than 93% of the population from 2005 to 2016 (Table 4). Different patterns were shown for phenols and parabens. For Urinary Bisphenol S, Hispanic and Black adolescent and adults have the highest level, and the male adult group has an increasing and high level by comparing 2013-2014 cycle to 2015-2016 cycle (Table 5). Similarly, Hispanic female adolescents and adults tend to have the highest level of Urinary Benzophenone-3, and what should be noticed is that White female adolescent and adults are also high in levels (Table 6). Both Black children and Black female adults suffered from a higher level of Urinary Bisphenol A, but the concentration level has been decreased slightly throughout years (Table 7). Triclosan was highest in all Hispanic age groups except for elderly, while both Methyl Paraben and Propyl Paraben had a tendency of decreasing, comparing 1999-2000 cycle to 2015-2016 cycle, with the fact of Black participants have dominantly higher level than other races, and overall female participants have higher

level than male participants (Table 8, Table 9 & Table 10).

Discussion

This study suggests there are pronounced differences and changes in urinary metabolites of phthalates, phenols, and parabens among the U.S population between 1999-2016. Our observations indicate differences in product manufactured for and marketed to these different populations. Urinary metabolites of DnBP, DEP, DEHP, BBzP declined approximately 25% - 70%, whereas the concentration of DiBP increase about 300%. To our knowledge, this is the first study to date of temporal trends in phthalate, phenol, and paraben in PCPs exposure among nationally representative sample of the general U.S. population. Our findings are consistent with a previous study that also used NHANES dataset to evaluate chemical temporal trends (Zota et al. 2014).

In Zota's study, they concluded that the exposures to DnBP, BBzP, and DEHP have declined, but exposures to replacement phthalates such as DiNP and DiBP have increased (Zota et al. 2014). As we predicted, declines were observed in chemicals that have been banned or limited in use by the Consumer Product Safety Improvement Act of 2008 (CPSIA), including DnBP, BBzP, and DEHP in toys and childcare articles. However, such policy activities do not fully account for the patterns observed. For instance, Mono-benzyl phthalate, the urinary metabolite of BBzP, is highest among the youngest group of participants (<12 years old). Additionally, urinary metabolites of DnBP, BBzP, and DEHP were still detected in all race and age groups, and the decline for DnBP was the modest, which is identical with the Zota's study.

Mono-ethyl phthalate, the urinary metabolite of DEP, which experienced the most profound reduction in our study period, represents some of the effects of advocacy of changing the formulation of personal care products, since PCPs are an important source of exposure to DEP (Duty et al. 2005; Koch et al. 2013). Since DEP, DEHP, DiBP, and

DnBP can be detected in more than 99% of the PCPs including fragrance, hair care, deodorant, nail polish and even baby product (Koniecki et al. 2011), the level of monoethyl phthalate can reflect the exposure to PCP chemical properly. Additionally, DEP and parabens are found to be abundant in hair products, including hair relaxers and hair oil (Helm et al. 2018). The Black Women's Health Study surveyed African American women and found that 94% under age 45 and 89% over age 45 use perms or relaxer, and The Women's Circle of Health Study corroborates findings, reporting 87% of African American women, but 6% of European American women have a history of regularly using chemical relaxers (McDonald et al. 2018). Thus, personal care products that high in DEP and parabens could be tended to be marketed to African American females, especially for products like hair relaxers or hair oils, which corroborates our finding that Black females have the highest level of both mono-ethyl phthalate and parabens throughout the whole observation period from 1999 to 2016.

Meanwhile, another focus would be Benzophenone-3 (BP-3), a commonly used chemical in sunscreens and personal care products to help diminish the damaging effects of ultraviolet radiation (Ghazipura et al. 2017). BP-3 has received elevated attention due to the public acknowledgement of the adverse impacts from BP-3 exposure upon child development and reproductive issue. Previous studies show differences in use of personal care products containing BP-3, and the differences most likely result from increased use of products containing BP-3 by people with light skin pigmentation (Calafat et al. 2008). However, no evidence shows why Hispanic adolescents and adults experiencing high exposure of BP-3 as well, one guess would be that Hispanics also belongs to the light skin pigmentation so that they also tend to use sunscreens more often. Further evidence is needed for supporting the tendency of white female using sunscreens thus has a relatively higher exposure level of BP-3, and

more research is required to find out the reason that the Hispanic community also suffered from BP-3 exposure.

Different from most phthalate metabolites, Mono-isobutyl phthalate, the urinary metabolite of DiBP, has a unique increasing tendency from its first detection in 2001, at an increasing rate of 300%. Although the tendency can be explained by using DiBP as the replacement of DBP, no evidence can explain the highest exposure level in Hispanic and Black female participants in each cycle, and the relatively higher level among all race children and adolescent groups, thus further study focusing on the usage pattern of DiBP for Hispanic and Black communities are necessary. Urinary Bisphenol S is another metabolite showing a different tendency that increases in recent years, however, since measurement of urinary Bisphenol S was introduced to NHANES from 2013, there are not enough data to analyze, and so more NHANES data is expected to conclude the result for Bisphenol S.

Other metabolites were also higher in mostly Hispanic and Black participants, which suggests a potential disparity problem. Many of the more expensive products found on the market today profess to be “phthalate and paraben free”, but these are primarily in higher end products that are specifically targeted to white female populations whereas those products marketed specifically to Blacks or Hispanics are less likely to make this claim. The Health and Environmental Research on Makeup of Salinas Adolescents (HERMOSA) Study by UC Berkley suggests that by choosing personal care products that are labeled to be free of phthalates, parabens, triclosan, and BP-3, can reduce exposure to potential endocrine-disrupting chemicals (Harley et al. 2016). Further study needs probe the consumption pattern of personal care products for difference races, and more variables should be considered, like social economic status and accessibility to those chemical-free products, and so scientists can get into the disparity and advocate

public health policies in the future.

There are several strengths to this study. NHANES captures a nationally representative sample of the general U.S population, which guarantees the diversity of demographic factors, including age, race/ethnicity, income level. The big dataset allows us to do reliable time trend analysis for each subgroup, with great statistical power. Additionally, this study allows us to have an overview of how different class of EDCs change over a long period of time in each small subgroup, which could provide guidance and speculation for future studies.

The main limitation is the design of NHANES, consideration of sociodemographic variables, and the limitation of using biomarkers. NHANES is designed to be cross-sectional, which prevents the assessment of individual longitudinal changes in metabolite concentrations for same participants every cycle. Additionally, NHANES only examine children ages 6 to 17 years, which means our findings may not be generalizable to younger children below 6 years of age. Considering higher susceptibility of getting affected by EDCs in PCPs, more biomonitoring studies should be conducted to supplement NHANES dataset. For this study, only age group, race/ethnicity and sex were taken into consideration, variables like education level and annual family income should be considered if necessary. Finally, it is generally recognized that biomarkers integrate all routes of exposures, thus cannot properly reflect the exposure route. Environmental endocrine disrupting is usually due not only the effect of a single compound, but an effect of mixtures of different chemicals at low concentrations (Hipwell et al. 2018). In addition, phthalates, parabens, and phenols can be all used in the same personal care products, like cosmetics, which makes the individual metabolite level have synergistic or cumulative association with health effects (Webster, 2013). Longitudinal studies should be employed to investigate true

exposure level, especially for minority segments of the population.

Table 1. Demographics of National Health and Nutrition Examination Survey cycles evaluated (1999-2016)

Demographics	Gender (male/female)	Age	Hispanic	NH Blacks	NH Whites	Mexican American	Other	N
1999-2000	49.0%, 51.0%	98.3% (<85)	4.7%	22.4%	34.4%	34.0%	3.9%	2541
2001-2002	48.3%, 51.7%	97.9% (<85)	5.9%	24.3%	41.7%	25.1%	2.9%	2782
2003-2004	49.1%, 50.9%	97.8% (<85)	3.4%	26.30%	40.8%	24.9%	3.3%	2517
2005-2006	49.1%, 50.9%	98.4% (<85)	3.4%	26.2%	38.0%	27.5%	5.0%	2548
2007-2008	50.2%, 49.8%	95.7% (<80)	11.8%	21.8%	40.5%	21.3%	4.6%	2604
2009-2010	49.6%, 50.4%	96.0% (<80)	10.8%	18.6%	41.9%	22.6%	6.1%	2749
2011-2012	49.8%, 50.2%	96.3% (<80)	11.0%	27.5%	30.5%	13.9%	17.1%	2489
2013-2014	49.2%, 50.8%	96.5% (<80)	9.4%	22.3%	36.1%	17.0%	15.2%	2686
2015-2016	49.1%, 50.9%	96.2% (<80)	13.1%	21.4%	30.7%	19.3%	15.5%	2651
								23567

Table 2. Creatinine frequency of detection, National Health and Nutrition Examination Survey cycles evaluated (1999-2016)

Albumin and Creatinine	Creatinine, urine (mg/dL)
1999-2000	97.30%
2001-2002	96.80%
2003-2004	97.00%
2005-2006	97.00%
2007-2008	96.90%
2009-2010	97.80%
2011-2012	N/A
2013-2014	97.10%
2015-2016	96.20%

Table 3. Phthalate frequency of detection, National Health and Nutrition Examination Survey cycles evaluated (1999-2016)

Phthalates	Environmental B 2- year weights	Mono-n- butyl phthalate (ng/mL)	Mono- ethyl phthalate (ng/mL)	MEHP phthalate (ng/mL)	Mono-(2- ethyl)- hexyl phthalate (ng/mL)	Mono- isobutyl phthalate (ng/mL)	MEOH phthalate (ng/mL)	Mono- benzyl phthalate (ng/mL)
1999-2000								
2001-2002								
2003-2004		99.50%	100%		70.10%	97.50%		99.70%
2005-2006		99.70%	99.80%		68.80%	97.90%		98.90%
2007-2008		99.30%	100%		67.10%	98.20%		98.20%
2009-2010		99.60%	100%		77.40%	99.80%		99.50%
2011-2012		94.40%	99.90%		76.70%	99.00%		98.20%
2013-2014	98.20%	98.40%	99.80%	99%	62.40%	97.30%	99.50%	97.60%
2015-2016	98.30%	99.30%	92.40%	99.50%	62.30%	98.50%	99.50%	97.90%

Table 4. Phenol frequency of detection, National Health and Nutrition Examination Survey cycles evaluated (1999-2016)

Phenols	Subsample B weights	Urinary Benzophenone-3 (ng/mL)	Urinary Bisphenol A (ng/mL)	Urinary Bisphenol F (ng/mL)	Urinary Bisphenol S (ng/mL)	Urinary Triclosan (ng/mL)	Ethyl paraben (ng/mL)	Methyl paraben (ng/mL)	Propyl paraben (ng/mL)	2,5-dichlorophenol (ng/mL)	2,4-dichlorophenol (ng/mL)
1999-2000											
2001-2002											
2003-2004		97.10%	93.50%			74.10%				98.70%	84.90%
2005-2006		97.30%	92.90%			80.50%	39.60%	99.10%	93.80%	98.90%	91.60%
2007-2008		96.10%	93.60%			80.20%	46.40%	99.70%	94.80%	99.00%	91.40%
2009-2010		98.00%	92.00%			76.80%	48.90%	99.40%	92.90%	98.00%	88.10%
2011-2012		98.00%	89.70%			71.90%	44.10%	98.90%	94.20%	96.70%	96.70%
2013-2014	98.20%	96.80%	96%	64.60%	90.00%	76.20%	47.00%	99.40%	98.80%	98.40%	95.30%
2015-2016	98.00%	95.50%	94.80%	43.80%	90.20%	65.60%	44.70%	97.90%	98.40%	97.20%	92.00%

Table 5. Distribution of BPS, National Health and Nutrition Examination Survey cycles evaluated (1999-2016)

Urinary Bisphenol S (ng/mL)		N	Min	Max	STD	SE	25th	Median	75th	95th	GM
